

ABSTRACT OF THE DISCLOSURE

An outlet airflow direction control device mainly includes a frame and a fan. The frame has an inlet and
5 an outlet via which an amount of fluid flows into and out of the frame, and is internally provided at a predetermined position with a hub seat. The hub seat is provided on a peripheral wall with a plurality of radially projected fluid control elements. The fan is
10 mounted on the hub seat in the frame. When the fan is rotated to cause an amount of fluid to flow through the outlet of the frame, the fluid control elements are adapted to control a flow direction of the fluid flown out of the outlet.
